计算机系统基础08

Machine-Level Programming IV: Data

Today

- **Arrays**
  - One-dimensional
  - Multi-dimensional (nested)
  - Multi-level

- **Structures**
 - Allocation
  - Access
  - Alignment

Reminder: Memory Organization

- **Memory locations do not have data types**
  - Types are implicit in how machine instructions *use* memory

- **Addresses specify byte locations**
  - Address of a larger datum is the address of its first byte
 - Addresses of successive items differ by the item's size

Address	chars	ints	longs
4000			
4001		**Addr =** 4000	
4002			
4003			**Addr =** 4000
4004			
4005		**Addr =** 4004	
4006			
4007			
4008			
4009		**Addr =** 4008	
400A			**Addr =** 4008
400B			
400C			
400D		**Addr =** 400C	
400E			
400F			

Bryant and O'Hallaron, Computer Systems: A Programmer's Perspective, Third Edition

Array Allocation

- ## Basic Principle

  T `A[`L`];`

  - Array of data type T and length L
 - Contiguously allocated region of L * `sizeof`(T) bytes in memory

`char string[12];`

x $x + 12$

`int val[5];`

x $x + 4$ $x + 8$ $x + 12$ $x + 16$ $x + 20$

`double a[3];`

x $x + 8$ $x + 16$ $x + 24$

`char *p[3];`

x $x + 8$ $x + 16$ $x + 24$

Array Access

- ## Basic Principle

  T **A[***L***];**

  - Array of data type *T* and length *L*
  - Identifier **A** can be used as a pointer to array element 0: Type *T**

  int val[5];

1	5	2	1	3

  x   x + 4   x + 8   x + 12   x + 16   x + 20

- ## Reference   Type   Value

 | Reference | Type | Value |
  |-----------|------|-------|
  | **val[4]** | **int** | 3 |
  | **val** | **int *** | |
  | **val+1** | **int *** | |
  | **&val[2]** | **int *** | |
  | **val[5]** | **int** | |
  | ***(val+1)** | **int** | |
  | **val + *i*** | **int *** | |

Array Access

- ## Basic Principle

  T `A[`L`];`

  - Array of data type T and length L
 - Identifier `A` can be used as a pointer to array element 0: Type $T*$

  ```
  int val[5];
  ```

1	5	2	1	3

  x   x + 4   x + 8   x + 12   x + 16   x + 20

- ## Reference   Type   Value

| Reference	Type	Value	
`val[4]`	`int`	`3`	
`val`	`int *`	`x`	
`val+1`	`int *`	`x + 4`	
`&val[2]`	`int *`	`x + 8`	
`val[5]`	`int`	`??`	
`*(val+1)`	`int`	`5`	`//val[1]`
`val + i`	`int *`	`x + 4 * i`	`//&val[i]`

Array Example

```
#define ZLEN 5
typedef int zip_dig[ZLEN];

zip_dig cmu = { 1, 5, 2, 1, 3 };
zip_dig mit = { 0, 2, 1, 3, 9 };
zip_dig ucb = { 9, 4, 7, 2, 0 };
```

`zip_dig cmu;`

| 1 | 5 | 2 | 1 | 3 |

16 20 24 28 32 36

`zip_dig mit;`

| 0 | 2 | 1 | 3 | 9 |

36 40 44 48 52 56

`zip_dig ucb;`

| 9 | 4 | 7 | 2 | 0 |

56 60 64 68 72 76

- **Declaration "`zip_dig cmu`" equivalent to "`int cmu[5]`"**
- **Example arrays were allocated in successive 20 byte blocks**
  - Not guaranteed to happen in general

Array Accessing Example

```
zip_dig cmu;
```

1	5	2	1	3

16   20   24   28   32   36
```
int get_digit
   (zip_dig z, int digit)
{
   return z[digit];
}
```

x86-64

```
# %rdi = z
# %rsi = digit
movl (%rdi,%rsi,4), %eax  # z[digit]
```

- **Register `%rdi` contains starting address of array**
- **Register `%rsi` contains array index**
- **Desired digit at `%rdi + 4*%rsi`**
- **Use memory reference `(%rdi,%rsi,4)`**

Array Loop Example

```
void zincr(zip_dig z) {
  size_t i;
  for (i = 0; i < ZLEN; i++)
    z[i]++;
}
```

```
  # %rdi = z
  movl    $0, %eax
  jmp     .L3
.L4:
  addl    $1, (%rdi,%rax,4)
  addq    $1, %rax
.L3:
  cmpq    $4, %rax
  jbe     .L4
  rep; ret
```

Array Loop Example

```
void zincr(zip_dig z) {
  size_t i;
  for (i = 0; i < ZLEN; i++)
    z[i]++;
}
```

```
  # %rdi = z
  movl    $0, %eax          #   i = 0
  jmp     .L3               #   goto middle
.L4:                        # loop:
  addl    $1, (%rdi,%rax,4) #   z[i]++
  addq    $1, %rax          #   i++
.L3:                        # middle
  cmpq    $4, %rax          #   i:4
  jbe     .L4               #   if <=, goto loop
  rep; ret
```

Multidimensional (Nested) Arrays

- **Declaration**

    T `A`[R][C];

    - 2D array of data type T
    - R rows, C columns

- **Array Size**
    - $R * C *$ `sizeof(`T`)` bytes

- **Arrangement**
    - Row-Major Ordering

$$\begin{bmatrix} A[0][0] & \cdots & A[0][C-1] \\ \vdots & & \vdots \\ A[R-1][0] & \cdots & A[R-1][C-1] \end{bmatrix}$$

`int A[R][C];`

| A [0] [0]	$\cdots$	A [0] [C-1]	A [1] [0]	$\cdots$	A [1] [C-1]	$\cdots$	A [R-1] [0]	$\cdots$	A [R-1] [C-1]

$\longleftarrow$ **4*R*C** Bytes $\longrightarrow$
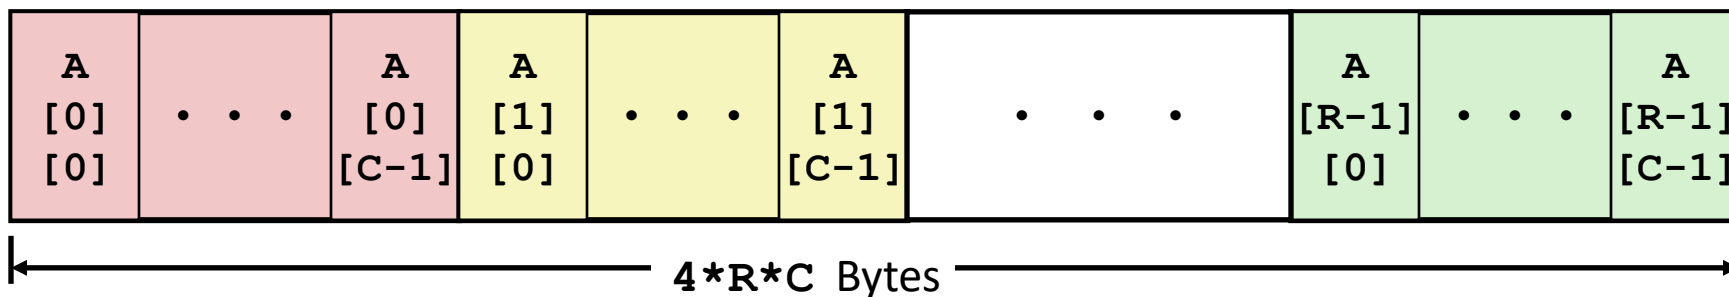

Nested Array Example

```
#define PCOUNT 4
typedef int zip_dig[5];

zip_dig pgh[PCOUNT] =
  {{1, 5, 2, 0, 6},
   {1, 5, 2, 1, 3 },
   {1, 5, 2, 1, 7 },
   {1, 5, 2, 2, 1 }};
```

`zip_dig`
`pgh[4];`

| 1 | 5 | 2 | 0 | 6 | 1 | 5 | 2 | 1 | 3 | 1 | 5 | 2 | 1 | 7 | 1 | 5 | 2 | 2 | 1 |

76   96   116   136   156

- **"`zip_dig pgh[4]`" equivalent to "`int pgh[4][5]`"**
  - Variable **`pgh`**: array of 4 elements, allocated contiguously
  - Each element is an array of 5 **`int`**'s, allocated contiguously
- **"Row-Major" ordering of all elements in memory**

Nested Array Row Access

- **Row Vectors**
  - **A[i]** is array of *C* elements of type *T*
  - Starting address **A + i * (C * sizeof(***T***))**

```
int A[R][C];
```

Nested Array Row Access Code

1	5	2	0	6	1	5	2	1	3	1	5	2	1	7	1	5	2	2	1

pgh
pgh[2]

```
int *get_pgh_zip(int index)
{
    return pgh[index];
}
```

```
 # %rdi = index
 leaq (%rdi,%rdi,4),%rax  # 5 * index
 leaq pgh(,%rax,4),%rax   # pgh + (20 * index)
```

- **Row Vector**
  - **pgh[index]** is array of 5 **int**'s
  - Starting address **pgh+20*index**
- **Machine Code**
  - Computes and returns address
  - Compute as **pgh + 4*(index+4*index)**

# Nested Array Element Access

- **Array Elements**
  - `A[i][j]` is element of type *T*, which requires *K* bytes
  - Address `A + i * (C * K) +  j * K`
    `= A + (i * C + j) * K`

`int A[R][C];`

Nested Array Element Access Code

| 1 | 5 | 2 | 0 | 6 | 1 | 5 | 2 | 1 | 3 | 1 | 5 | 2 | 1 | 7 | 1 | 5 | 2 | 2 | 1 |

↑
pgh   ↑
               pgh[1][1]

```
int get_pgh_digit(int index, int dig)
{
    return pgh[index][dig];
}
```

```
leaq   (%rdi,%rdi,4), %rax    # 5*index
addl   %rax, %rsi             # 5*index+dig
movl   pgh(,%rsi,4), %eax     # M[pgh + 4*(5*index+dig)]
```
- **Array Elements**
  - `pgh[index][dig]` is `int`
  - Address: `pgh + (5*4)*index + 4*dig`
    `= pgh + 4*(5*index + dig)`

Multi-Level Array Example

```
zip_dig cmu = { 1, 5, 2, 1, 3 };
zip_dig mit = { 0, 2, 1, 3, 9 };
zip_dig ucb = { 9, 4, 7, 2, 0 };
```
```
#define UCOUNT 3
int *univ[UCOUNT] = {mit, cmu, ucb};
```

- **Variable `univ` denotes array of 3 elements**
- **Each element is a pointer**
  - 8 bytes
- **Each pointer points to array of `int`'s**

Element Access in Multi-Level Array

```
int get_univ_digit
   (size_t index, size_t digit)
{
   return univ[index][digit];
}
```

```
   salq     $2, %rsi              # 4*digit
   addq     univ(,%rdi,8), %rsi  # p = univ[index] + 4*digit
   movl     (%rsi), %eax          # return *p
   ret
```
- **Computation**
  - Element access `Mem[Mem[univ+8*index]+4*digit]`
  - Must do two memory reads
    - First get pointer to row array
    - Then access element within array
Array Element Accesses

Nested array

```
int get_pgh_digit
  (size_t index, size_t digit)
{
  return pgh[index][digit];
}
```

Multi-level array

```
int get_univ_digit
  (size_t index, size_t digit)
{
  return univ[index][digit];
}
```

Accesses looks similar in C, but address computations very different:

Mem[pgh+20*index+4*digit]   **Mem[Mem[univ+8*index]+4*digit]**

N X *N* Matrix Code

- **Fixed dimensions**
  - Know value of *N* at compile time

```
#define N 16
typedef int fix_matrix[N][N];
/* Get element A[i][j] */
int fix_ele(fix_matrix A,
            size_t i, size_t j)

{
  return A[i][j];
}
```

- **Variable dimensions, explicit indexing**
  - Traditional way to implement dynamic arrays

```
#define IDX(n, i, j) ((i)*(n)+(j))
/* Get element A[i][j] */
int vec_ele(size_t n, int *A,
            size_t i, size_t j)
{
  return A[IDX(n,i,j)];
}
```

- **Variable dimensions, implicit indexing**
  - Now supported by gcc

```
/* Get element a[i][j] */
int var_ele(size_t n, int A[n][n],
            size_t i, size_t j) {
  return A[i][j];
}
```

16 X 16 Matrix Access

- **Array Elements**
  - `int A[16][16];`
  - Address `A + i * (C * K) + j * K`
  - C = 16, K = 4

```
/* Get element A[i][j] */
int fix_ele(fix_matrix A, size_t i, size_t j) {
  return A[i][j];
}
```

```
# A in %rdi, i in %rsi, j in %rdx
salq    $6, %rsi            # 64*i
addq    %rsi, %rdi          # A + 64*i
movl    (%rdi,%rdx,4), %eax  # M[A + 64*i + 4*j]
ret
```

n X *n* Matrix Access

- **Array Elements**
  - **size_t n;**
  - **int A[n][n];**
  - Address **A + i * (C * K) + j * K**
  - C = n, K = 4
  - Must perform integer multiplication

```
/* Get element A[i][j] */
int var_ele(size_t n, int A[n][n], size_t i, size_t j)
{
  return A[i][j];
}
```

```
# n in %rdi, A in %rsi, i in %rdx, j in %rcx
imulq    %rdx, %rdi            # n*i
leaq     (%rsi,%rdi,4), %rax   # A + 4*n*i
movl     (%rax,%rcx,4), %eax   # A + 4*n*i + 4*j
ret
```

Example: Array Access

```c
#include <stdio.h>
#define ZLEN 5
#define PCOUNT 4
typedef int zip_dig[ZLEN];

int main(int argc, char** argv) {
zip_dig pgh[PCOUNT] =
    {{1, 5, 2, 0, 6},
     {1, 5, 2, 1, 3 },
     {1, 5, 2, 1, 7 },
     {1, 5, 2, 2, 1 }};
    int *linear_zip = (int *) pgh;
    int *zip2 = (int *) pgh[2];
    int result =
        pgh[0][0] +
        linear_zip[7] +
        *(linear_zip + 8) +
        zip2[1];
    printf("result: %d\n", result);
    return 0;
}
```

```
linux> ./array
result: 9
```

Example: Array Access

```c
#include <stdio.h>
#define ZLEN 5
#define PCOUNT 4
typedef int zip_dig[ZLEN];

int main(int argc, char** argv) {
zip_dig pgh[PCOUNT] =
    {{1, 5, 2, 0, 6},
     {1, 5, 2, 1, 3 },
     {1, 5, 2, 1, 7 },
     {1, 5, 2, 2, 1 }};
    int *linear_zip = (int *) pgh;
    int *zip2 = (int *) pgh[2];
    int result =
        pgh[0][0] +
        linear_zip[7] +
        *(linear_zip + 8) +
        zip2[1];
    printf("result: %d\n", result);
    return 0;
}
```

```
linux> ./array
result: 9
```

Bryant and O'Hallaron, Computer Systems: A Programmer's Perspective, Third Edition

Today

- **Arrays**
  - One-dimensional
  - Multi-dimensional (nested)
  - Multi-level
- **Structures**
  - Allocation
  - Access
  - Alignment

Structure Representation

```
struct rec {
    int a[4];
    size_t i;
    struct rec *next;
};
```

r

a	i	next

0   16   24   32
- **Structure represented as block of memory**
  - **Big enough to hold all of the fields**
- **Fields ordered according to declaration**
  - **Even if another ordering could yield a more compact representation**
- **Compiler determines overall size + positions of fields**
  - **Machine-level program has no understanding of the structures in the source code**

Generating Pointer to Structure Member

```
struct rec {
    int a[4];
    size_t i;
    struct rec *next;
};
```

r   r+4*idx

a		i	next
0	16	24	32
- **Generating Pointer to Array Element**
  - Offset of each structure member determined at compile time
  - Compute as **r + 4*idx**

```
int *get_ap
 (struct rec *r, size_t idx)
{
  return &r->a[idx];
}
```

```
# r in %rdi, idx in %rsi
leaq  (%rdi,%rsi,4), %rax
ret
```

Following Linked List

```
struct rec {
    int a[4];
    int i;
    struct rec *next;
};
```

- **C Code**

```
void set_val
  (struct rec *r, int val)
{
  while (r) {
    int i = r->i;
    r->a[i] = val;
    r = r->next;
  }
}
```

r

a		i	next

0   16   24   32
Element i

Register	Value
%rdi	r
%rsi	val

```
.L11:                          #  loop:
  movslq  16(%rdi), %rax       #    i = M[r+16]
  movl    %esi, (%rdi,%rax,4)  #    M[r+4*i] = val
  movq    24(%rdi), %rdi       #    r = M[r+24]
  testq   %rdi, %rdi           #    Test r
  jne     .L11                 #    if !=0 goto loop
```

Structures & Alignment

对齐

- ## Unaligned Data

c	i[0]	i[1]	v

p p+1   p+5   p+9   p+17
```
struct S1 {
  char c;
  int i[2];
  double v;
} *p;
```

- ## Aligned Data

  - Primitive data type requires **K** bytes
  - Address must be multiple of **K**

c	3 bytes	i[0]	i[1]	4 bytes	v

p+0   p+4   p+8   p+16   p+24

↑ **Multiple of 8**

↑ **Multiple of 4**

↑ **Multiple of 8**
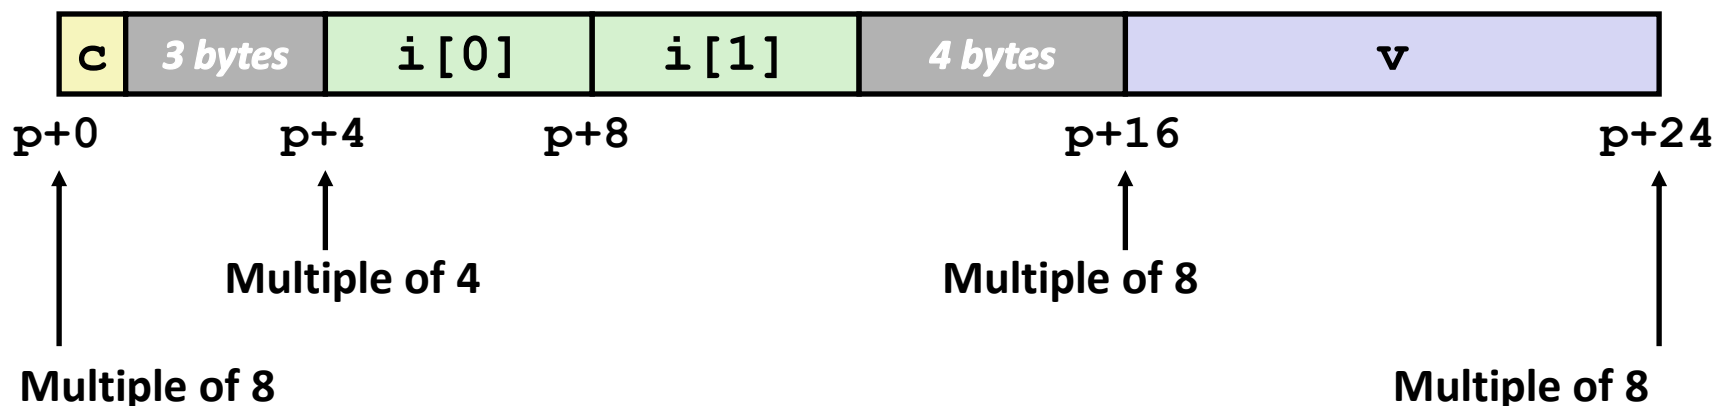

↑ **Multiple of 8**

Alignment Principles

- **Aligned Data**
  - Primitive data type requires *K* bytes
  - Address must be multiple of *K*
  - Required on some machines; advised on x86-64

- **Motivation for Aligning Data**
  - Memory accessed by (aligned) chunks of 4 or 8 bytes (system dependent)
    - Inefficient to load or store datum that spans cache lines (64 bytes). Intel states should avoid crossing 16 byte boundaries.
    - Virtual memory trickier when datum spans 2 pages (4 KB pages)

- **Compiler**
  - Inserts gaps in structure to ensure correct alignment of fields

Specific Cases of Alignment (x86-64)

- **1 byte: `char, …`**
  - no restrictions on address
- **2 bytes: `short, …`**
  - lowest 1 bit of address must be 0_2
- **4 bytes: `int, float, …`**
  - lowest 2 bits of address must be 00_2
- **8 bytes: `double, long, char *, …`**
  - lowest 3 bits of address must be 000_2

Satisfying Alignment with Structures

- **Within structure:**
  - Must satisfy each element's alignment requirement

- **Overall structure placement**
  - Each structure has alignment requirement **K**
    - **K** = Largest alignment of any element
  - Initial address & structure length must be multiples of **K**

- **Example:**
  - K = 8, due to **double** element

```
struct S1 {
  char c;
  int i[2];
  double v;
} *p;
```

c	3 bytes	i[0]	i[1]	4 bytes	v

p+0   p+4   p+8   p+16   p+24

Multiple of 4

Multiple of 8

Multiple of 8
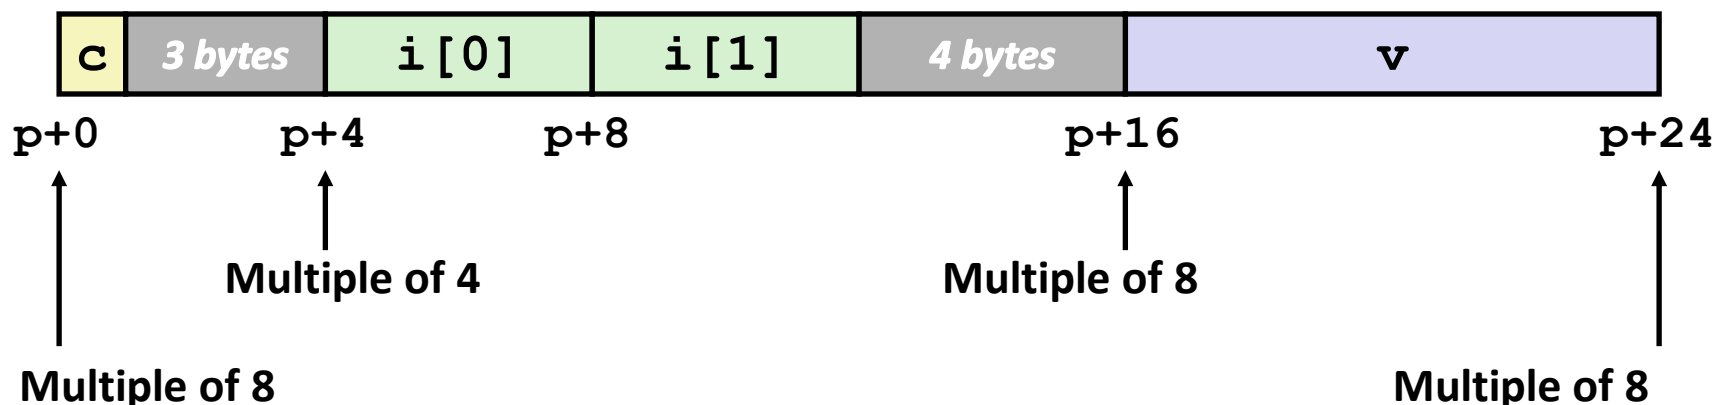

Multiple of 8

Meeting Overall Alignment Requirement

- **For largest alignment requirement K**
- **Overall structure must be multiple of K**

```
struct S2 {
  double v;
  int i[2];
  char c;
} *p;
```

v	i[0]	i[1]	c	7 bytes

p+0   p+8   p+16   p+24
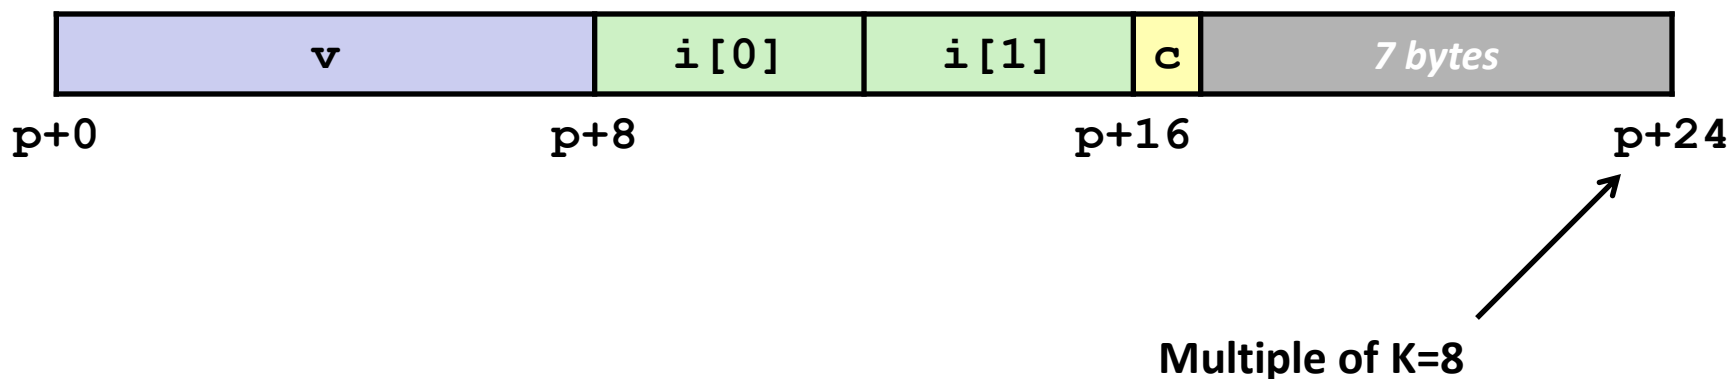

Multiple of K=8

Arrays of Structures

- **Overall structure length multiple of K**

- **Satisfy alignment requirement for every element**

```
struct S2 {
  double v;
  int i[2];
  char c;
} a[10];
```

a[0]	a[1]	a[2]

a+0   a+24   a+48   a+72

v	i[0]	i[1]	c	7 bytes

a+24   a+32   a+40   a+48
Accessing Array Elements

```
struct S3 {
    short i;
    float v;
    short j;
} a[10];
```

- **Compute array offset 12*idx**
  - **sizeof(S3)**, including alignment spacers
- **Element j is at offset 8 within structure**
- **Assembler gives offset a+8**
  - Resolved during linking

a[0]	• • •	a[idx]	• • •

a+0   a+12   a+12*idx

i	2 bytes	v	j	2 bytes

a+12*idx   a+12*idx+8
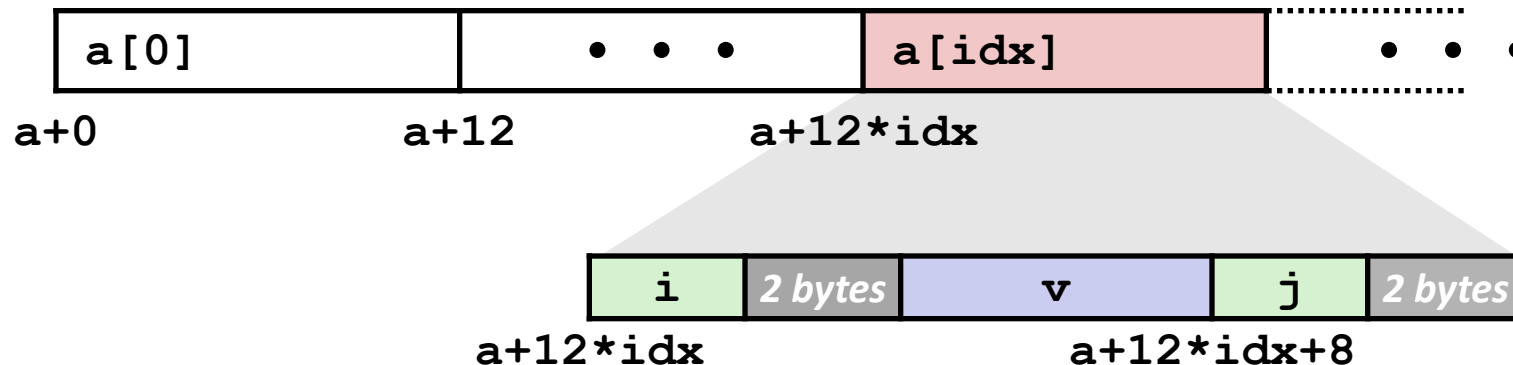

```
short get_j(int idx)
{
    return a[idx].j;
}
```

```
# %rdi = idx
leaq (%rdi,%rdi,2),%rax # 3*idx
movzwl a+8(,%rax,4),%eax
```

Saving Space

- **Put large data types first**

```
struct S4 {
  char c;
  int i;
  char d;
} *p;
```

➡

```
struct S5 {
  int i;
  char c;
  char d;
} *p;
```
| c | 3 bytes | i | d | 3 bytes |

- **Effect (largest alignment requirement K=4)**

| i | c | d | 2 bytes |

Example Struct Exam Question

Problem 5. (8 points):

Struct alignment. Consider the following C struct declaration:

```
typedef struct {
  char a;
  long b;
  float c;
  char d[3];
  int *e;
  short *f;
} foo;
```

1. Show how foo would be allocated in memory on an x86-64 Linux system. Label the bytes with the names of the various fields and **clearly mark the end of the struct**. Use an X to denote space that is allocated in the struct as padding.

```
+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+

Example Struct Exam Question

Problem 5. (8 points):

Struct alignment. Consider the following C struct declaration:

```c
typedef struct {
  char a;
  long b;
  float c;
  char d[3];
  int *e;
  short *f;
} foo;
```

1. Show how foo would be allocated in memory on an x86-64 Linux system. Label the bytes with the names of the various fields and **clearly mark the end of the struct**. Use an X to denote space that is allocated in the struct as padding.

```
+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+
|a |X |X |X |X |X |X |X |b |b |b |b |b |b |b |b |
+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+

+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+
|c |c |c |c |d |d |d |X |e |e |e |e |e |e |e |e |
+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+

+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+
|f |f |f |f |f |f |f |f |  |  |  |  |  |  |  |  |
+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+

+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+
```

Example Struct Exam Question (Cont'd)

Problem 5. (8 points):

Struct alignment. Consider the following C struct declaration:

```
typedef struct {
  char a;
  long b;
  float c;
  char d[3];
  int *e;
  short *f;
} foo;
```

2. Rearrange the elements of foo to conserve the most space in memory. Label the bytes with the names of the various fields and **clearly mark the end of the struct**. Use an X to denote space that is allocated in the struct as padding.

```
+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+
+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+
+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+
+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+
```

Summary

- **Arrays**
  - Elements packed into contiguous region of memory
  - Use index arithmetic to locate individual elements

- **Structures**
  - Elements packed into single region of memory
  - Access using offsets determined by compiler
  - Possible require internal and external padding to ensure alignment

- **Combinations**
  - Can nest structure and array code arbitrarily
